

Sol Dex Bot Trader

End-User Guide — Install, Run, Wallet, Operate, Safety

Version 1.1.2 · Guide built 2026-07-26 20:22:51 Eastern Daylight Time

RISK DISCLAIMER — READ FIRST: Cryptocurrency trading is highly speculative. **Gains are not guaranteed.** You can lose some or all of the funds you allocate. Past paper or live results do not predict future performance. **You invest and trade at your own risk.** This software is a local trading assistant only — not financial advice.

1. Install & first launch (setup.exe)

Run **setup.exe**. Accept the prompts and finish the wizard. You do **not** need PowerShell scripts or .bat files. On the Finish page, an optional **Launch Sol Dex Bot Trader** checkbox appears (off by default) — check it only if you want to start the app immediately. Otherwise start from the Start Menu or Desktop shortcut when ready. Maintainer note: rebuilding with `build.bat` / `build.ps1` does **not** auto-start the app after the build finishes. On launch, the app starts the local server and opens your browser to `http://127.0.0.1:5000`.

Browser for Connect: Open the dashboard in **Chrome, Edge, or Brave** with the **Phantom or Solflare** extension installed. Wallet extensions do **not** work in some embedded / in-app browsers (the Connect approval popup will not appear).

Install & first launch

Install flow: setup.exe → optional Finish Launch checkbox → background app (tray) → browser dashboard (or start later from Start Menu / Desktop).

- **Install folder:** %LOCALAPPDATA%\Programs\Sol Dex Bot Trader\\ (Windows per-user Programs path)
- **.env created** under that folder on first launch (seeded from .env.example if missing). Full path example: %LOCALAPPDATA%\Programs\Sol Dex Bot Trader\\.env
- Start Menu and optional Desktop shortcut: **Sol Dex Bot Trader** (or check the optional Finish-page Launch checkbox). Desktop shortcut uses the **Pelish Crypto** medallion icon; the app / taskbar / tray use the **Cats of Crypto** icon.
- User Guide PDF installed under the app docs folder (also linked in Start Menu)
- Dashboard loads on localhost only — never expose port 5000 to the internet

2. Runs without a CMD / console window

No black CMD window: The packaged app runs as a **windowed background process** (no DOS/CMD console that must stay open). A **system tray icon** appears while the server is running. Your browser opens to `http://127.0.0.1:5000`. Diagnostics go to %LOCALAPPDATA%\Programs\Sol Dex Bot Trader\\logs\soldexbot.log.

How to tell it is running and how to stop it:

- **Running:** tray icon present + dashboard loads at `http://127.0.0.1:5000`
- **Stop (preferred):** right-click the tray icon → **Quit**
- **Stop (Start Menu):** **Stop Sol Dex Bot Trader** (runs `Stop-SolDexBot.bat`)
- **Stop (fallback):** `taskkill /IM SolDexBotTrader.exe /F`
- **Note:** Dashboard **Stop** only stops the trading loop — it does **not** exit the local server. Use tray Quit (or Stop shortcut) to fully shut down the app.
- **Logs:** if something fails, open %LOCALAPPDATA%\Programs\Sol Dex Bot Trader\\logs\soldexbot.log (tray menu also has **Open Logs Folder**)

Remember: Closing the browser tab does **not** stop the bot. Use tray **Quit** or Start Menu **Stop Sol Dex Bot Trader**. Relaunch from Start Menu / Desktop when you want the dashboard again.

Long-run reliability & auto-resume

The app is designed to run continuously until you Quit. Paper sessions default to **continuous** (no 24h auto-stop; optional PAPER_SESSION_HOURS timed window). Open paper and live trades are saved to disk on every open/update/close. If Flask or the process restarts, open books are reloaded and exit monitoring continues (stop-loss, instant profit, and 15-minute rules are unchanged). Live signing uses the in-memory Set Wallet key (ephemeral) or SOLANA_PRIVATE_KEY in .env — Stop Bot clears the dashboard key field and the ephemeral session key from memory (re-Set Wallet before the next Live start if you do not use .env). Session RPC pasted in the dashboard is also cleared on Stop. Windows keep-awake and a Flask supervisor/watchdog help prevent sleep and silent exits.

3. Supported wallets (Phantom or Solflare ONLY)

Wallets: Use **Phantom** or **Solflare** only. Do not use other wallets, hardware-export workflows this guide does not cover, or paste keys into untrusted websites.

Live trading requires two steps — Connect (extension) then Set Wallet (base58 key). Paper mode does not require a key.

- **1. Connect (upper right):** Click **Connect**. Approve in the **Phantom** or **Solflare** extension popup (the approval window must appear). Use **Chrome / Edge / Brave** with the extension installed — embedded browsers often block extension popups.
- **2. Set Wallet (base58):** Export your wallet's **base58 private key** (or JSON byte array) from Phantom/Solflare, paste it into the Wallet Key field, and click **Set Wallet**. This is **required** for server auto-sign.
- **3. Auto-sign after Set Wallet:** Live start fee and Jupiter swaps are signed on the server — **no extension popup per trade**.
- **4. Session key until Stop:** The key stays in the Wallet Key field and server memory across Paper Trade toggle and status polls. **Stop Bot** clears both the RPC and private-key fields and wipes the ephemeral session key (and session RPC override) from memory. You can set or update the key even while the bot is running.
- **Security:** Never share your private key with anyone. Prefer keeping it in memory only; use Save to .env only on a trusted personal PC.

4. Export private key — Phantom

Illustrative diagram (not a live screenshot). Typical path: Phantom → Settings → Security & Privacy → Export Private Key → authenticate → copy the base58 key into the bot's Wallet Key field → Set Wallet.

5. Export private key — Solflare

Illustrative diagram. Typical path: Solflare → Settings → Export Security / Private Key → authenticate → copy base58 into the bot → Set Wallet. Prefer keeping the key in memory only; use Save to .env only on a trusted personal PC.

6. Operate the bot

Illustrative dashboard overview. Your installed UI may differ slightly in layout.

- **Start Bot / Stop** — start or stop the trading loop (server stays running in the tray until you Quit)
- **Paper Trade** (recommended first) — simulated balance (default / start gate **2.00 SOL**; dropdown 0.75–5.00), real market data, no on-chain swaps, **no live-start fee**
- **Paper quote currency** — choose **USDC**, **USDT**, or **Solana** next to Paper Balance. The simulated wallet stays SOL-equivalent; USDC/USDT only change labels and conversion using live SOL/USD. Default is Solana.
- **Trade SOL/WSOL when daily +\$5** — when quote is USDC or USDT, an optional checkbox appears. Enable it to allow WSOL (mint So11111111111111111111111111111111112) entries when SOL's DexScreener 24h day gain is at least **+\$5** absolute USD. Does **not** weaken stop-loss, profit exits, or forced sells.
- **Live** — real Jupiter swaps with your funded wallet (**0.025 SOL** fee applies on each Live start — see section 8)
- **Open Trades** — view open positions; use **Sell** / Manual Sell for a full exit
- **Actions / Smart Re-entry** — when a re-entry decision is pending, use **Allow** or **Deny** in the Actions panel

7. Strategies — which button to use

Strategy buttons

Sol Dex Bot Trader

Strategy button row: Best Win · Steady Trade (recommended) · Balanced Win · Revert · Reset · Apply Config.

Button	What it does
Best Win	Strict filters — fewer, higher-quality entries
Steady Trade	Default / recommended — balanced pace with loss protections
Balanced Win	More trades, still fee-aware
Revert to bookmark	Restore the saved pre-strategy bookmark config
Reset Defaults	Reset spread / setup defaults
Apply Config	Apply the values currently shown in the Setup panel

8. Live trading fee (0.025 SOL)

Live-start fee: 0.025 SOL is charged **each time you start Live trading** (not per trade, not in Paper mode). Payment uses a temporary / rented relay wallet: your wallet → ephemeral relay → project fee wallet 8TdLLnveaK5iFD6dmVU7qfw8V14cM7CyCcHiZfgcRQM1. If the fee payment fails, Live start is blocked. **Gains are not guaranteed. You invest at your own risk.**

9. Safety

- No CMD window is required — stop fully via tray **Quit** or Start Menu **Stop Sol Dex Bot Trader**
- Runs on **localhost only** (127.0.0.1) — do not port-forward or expose publicly

- **Never share** your private key, seed phrase, or .env file
- Start with **Paper Trade** until you understand Start/Stop, strategies, and exits
- Keep only funds you can afford to lose in the trading wallet
- **Gains are not guaranteed** — markets move against you; you invest at your own risk

Final reminder: This bot can lose money in Live mode. **Gains are not guaranteed. Invest at your own risk.** By using Live trading you accept responsibility for your keys, fees, and trade outcomes.
